Cabinet de dermatologie Es-Senia

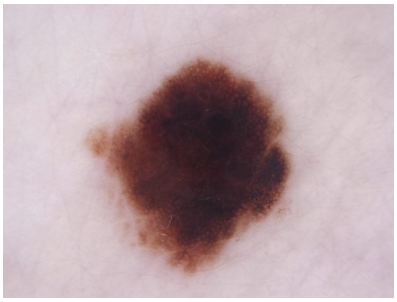

Triage support report — skin lesion

dermIA v2.0.0 · model ham10000-bcn20000-m5-v3 v3.0.0 (full profile)

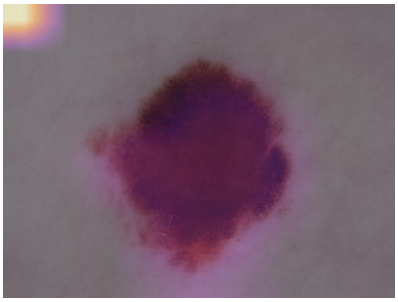

Patient	P-2026-0421	Analysis date	18/04/2026, 11:24
Age	70 years	Requested by	Dr Karim Haddad
Sex	female	Body site	lower limb
Tracked lesion	#1 — jambe gauche	Decision thresholds	original

URGENT

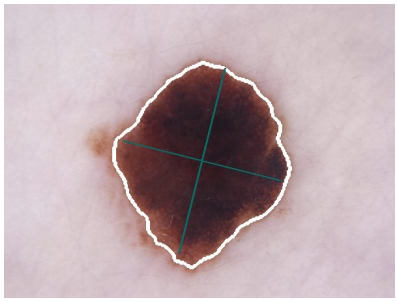

Suspected melanoma
The probability of melanoma exceeds the safety threshold. Prompt dermatological assessment recommended.

Analysed image

Most influential regions (Grad-CAM, “Melanoma”)

Outline and axes used for ABCD

Estimated probabilities

Diagnosis	Probability	In the guaranteed set*
Melanocytic nevus	55.2%	yes
Melanoma	44.8%	yes
Benign keratosis	0.0%	
Vascular lesion	0.0%	
Dermatofibroma	0.0%	
Basal cell carcinoma	0.0%	
Actinic keratosis / Bowen's disease	0.0%	

* Conformal set (Mondrian, alpha = 0.10): contains the true diagnosis with a probability of at least 90% for each class, assuming the cases resemble the calibration data. Melanoma decision if p(mel) ≥ 0.03 (cost ratio R = 10).
Original model thresholds, calibrated on its calibration set.

Automatic ABCD criteria (indicative)

Criterion	Measure	Detail
A — Asymmetry	2/2	asymmetric principal axes (shape or colours)
B — Border	0/8	sectors with an abrupt edge
C — Colours	3/6	light brown, dark brown, black
D — Diameter	8.0 mm	more than 6 mm

Indicative automatic measurements: on the HAM10000 test set, each separates melanoma from nevus only modestly (AUC 0.66 to 0.73). They do not replace dermoscopic examination.

Medical review

Confirmed by Dr Karim Haddad on 19/04/2026.
Final diagnosis: Melanoma

Physician's signature: _____
