Cabinet de dermatologie Es-Senia

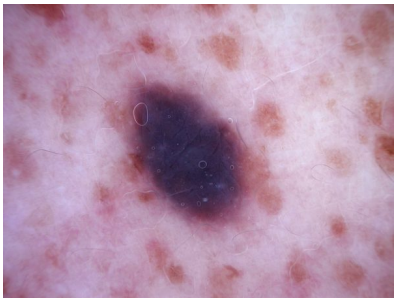

# Triage support report — skin lesion

dermIA v2.0.0 · model ham10000-bcn20000-m5-v3 v3.0.0 (full profile)

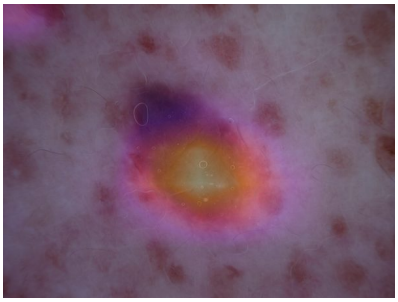

| | | | |
|---|---|---|---|
| Patient | P-2026-0422 | Analysis date | 09/03/2026, 13:49 |
| Age | 60 years | Requested by | Dr Karim Haddad |
| Sex | female | Body site | back |
| Tracked lesion | #1 — dos, sous l'omoplate gauche | Decision thresholds | original |

**PROBABLY BENIGN**

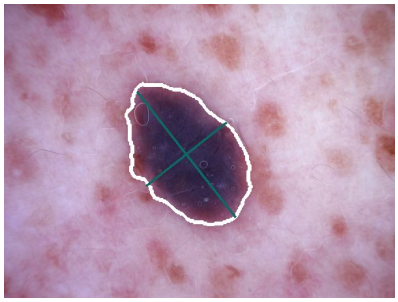

**Melanocytic nevus likely**
Probably benign lesion. Follow-up according to clinical judgement; any change in the lesion warrants a new examination.

Analysed image

Most influential regions (Grad-CAM, “Melanocytic nevus”)

Outline and axes used for ABCD

## Estimated probabilities

| Diagnosis | Probability | In the guaranteed set* |
|---|---|---|
| Melanocytic nevus | 100.0% | yes |
| Benign keratosis | 0.0% | |
| Melanoma | 0.0% | |
| Vascular lesion | 0.0% | |
| Basal cell carcinoma | 0.0% | |
| Dermatofibroma | 0.0% | |
| Actinic keratosis / Bowen's disease | 0.0% | |

* Conformal set (Mondrian, alpha = 0.10): contains the true diagnosis with a probability of at least 90% for each class, assuming the cases resemble the calibration data. Melanoma decision if p(mel) ≥ 0.03 (cost ratio R = 10).
Original model thresholds, calibrated on its calibration set.

## Automatic ABCD criteria (indicative)

| Criterion | Measure | Detail |
|---|---|---|
| A — Asymmetry | 0/2 | asymmetric principal axes (shape or colours) |
| B — Border | 1/8 | sectors with an abrupt edge |
| C — Colours | 3/6 | dark brown, blue-grey, black |
| D — Diameter | 6.4 mm | more than 6 mm |

Indicative automatic measurements: on the HAM10000 test set, each separates melanoma from nevus only modestly (AUC 0.66 to 0.73). They do not replace dermoscopic examination.

## Medical review

Confirmed by Dr Karim Haddad on 10/03/2026.
**Final diagnosis: Melanocytic nevus**
