Cabinet de dermatologie Es-Senia

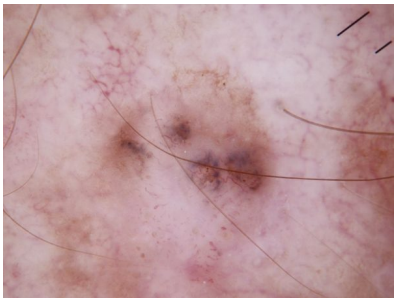

Triage support report — skin lesion

dermIA v2.0.0 · model ham10000-bcn20000-m5-v3 v3.0.0 (full profile)

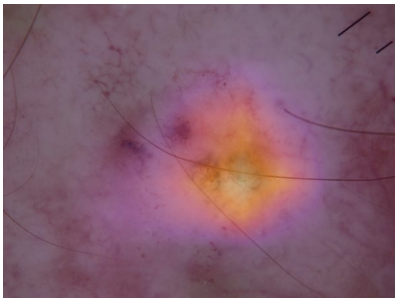

Patient	P-2026-0422	Analysis date	26/10/2026, 11:11
Age	65 years	Requested by	Dr Karim Haddad
Sex	male	Body site	back
Tracked lesion	#2	Decision thresholds	original

REFER TO A PHYSICIAN

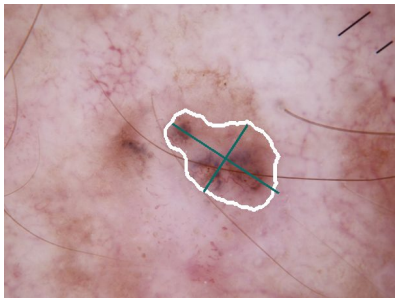

Uncertain result: the AI abstains
Several diagnoses remain plausible at the guaranteed confidence level. The case must be examined by a physician.

Analysed image

Most influential regions (Grad-CAM, “Benign keratosis”)

Outline and axes used for ABCD

Estimated probabilities

Diagnosis	Probability	In the guaranteed set*
Benign keratosis	63.3%	yes
Basal cell carcinoma	29.8%	yes
Actinic keratosis / Bowen's disease	4.2%	yes
Melanoma	2.0%	
Melanocytic nevus	0.7%	
Vascular lesion	0.0%	
Dermatofibroma	0.0%	

* Conformal set (Mondrian, alpha = 0.10): contains the true diagnosis with a probability of at least 90% for each class, assuming the cases resemble the calibration data. Melanoma decision if p(mel) ≥ 0.03 (cost ratio R = 10).
Original model thresholds, calibrated on its calibration set.

Automatic ABCD criteria (indicative)

Criterion	Measure	Detail
A — Asymmetry	1/2	asymmetric principal axes (shape or colours)
B — Border	4/8	sectors with an abrupt edge
C — Colours	2/6	dark brown, blue-grey
D — Diameter	5.0 mm	6 mm or less

Indicative automatic measurements: on the HAM10000 test set, each separates melanoma from nevus only modestly (AUC 0.66 to 0.73). They do not replace dermoscopic examination.

Medical review

Not yet reviewed by a physician.
