Cabinet de dermatologie Es-Senia

Triage support report — skin lesion

dermIA v2.0.0 · model ham10000-bcn20000-m5-v3 v3.0.0 (full profile)

Patient	P-2026-0428	Analysis date	29/10/2026, 14:56
Age	50 years	Requested by	Dr Karim Haddad
Sex	male	Body site	lower limb
Tracked lesion	#1	Decision thresholds	original

URGENT

Suspected melanoma
The probability of melanoma exceeds the safety threshold. Prompt dermatological assessment recommended.

Analysed image

Most influential regions (Grad-CAM, “Melanoma”)

Outline and axes used for ABCD

Estimated probabilities

Diagnosis	Probability	In the guaranteed set*
Dermatofibroma	57.0%	yes
Melanocytic nevus	25.2%	
Melanoma	16.4%	yes
Basal cell carcinoma	1.3%	
Benign keratosis	0.1%	
Vascular lesion	0.0%	
Actinic keratosis / Bowen's disease	0.0%	

* Conformal set (Mondrian, alpha = 0.10): contains the true diagnosis with a probability of at least 90% for each class, assuming the cases resemble the calibration data. Melanoma decision if p(mel) ≥ 0.03 (cost ratio R = 10).
Original model thresholds, calibrated on its calibration set.

Automatic ABCD criteria (indicative)

Criterion	Measure	Detail
A — Asymmetry	2/2	asymmetric principal axes (shape or colours)
B — Border	0/8	sectors with an abrupt edge
C — Colours	2/6	blue-grey, black
D — Diameter	11.6 mm	more than 6 mm

Caution: The lesion touches the image border: A, B and D are less reliable.
Indicative automatic measurements: on the HAM10000 test set, each separates melanoma from nevus only modestly (AUC 0.66 to 0.73). They do not replace dermoscopic examination.

Medical review

Not yet reviewed by a physician.
