Cabinet de dermatologie Es-Senia

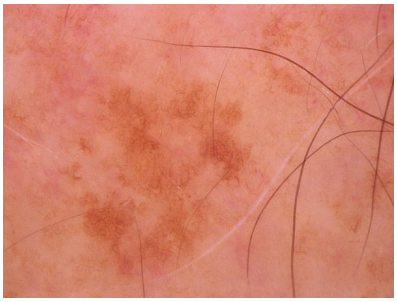

Triage support report — skin lesion

dermIA v2.0.0 · model ham10000-bcn20000-m5-v3 v3.0.0 (full profile)

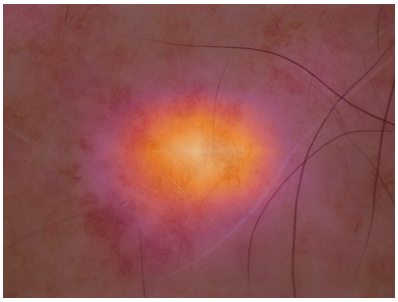

Patient	P-2026-0430	Analysis date	31/10/2026, 21:32
Age	60 years	Requested by	Dr Karim Haddad
Sex	male	Body site	upper limb
Tracked lesion	#1	Decision thresholds	original

PROBABLY BENIGN

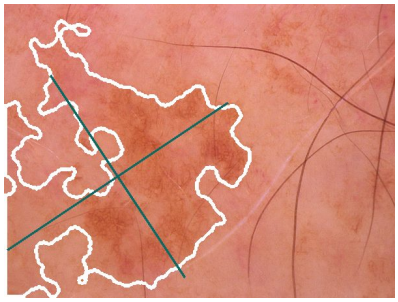

Benign keratosis likely
Probably benign lesion. Follow-up according to clinical judgement; any change in the lesion warrants a new examination.

Analysed image

Most influential regions (Grad-CAM, “Benign keratosis”)

Outline and axes used for ABCD

Estimated probabilities

Diagnosis	Probability	In the guaranteed set*
Benign keratosis	97.0%	yes
Melanocytic nevus	2.9%	
Melanoma	0.1%	
Dermatofibroma	0.0%	
Actinic keratosis / Bowen's disease	0.0%	
Vascular lesion	0.0%	
Basal cell carcinoma	0.0%	

* Conformal set (Mondrian, alpha = 0.10): contains the true diagnosis with a probability of at least 90% for each class, assuming the cases resemble the calibration data. Melanoma decision if p(mel) ≥ 0.03 (cost ratio R = 10).
Original model thresholds, calibrated on its calibration set.

Automatic ABCD criteria (indicative)

Criterion	Measure	Detail
A — Asymmetry	2/2	asymmetric principal axes (shape or colours)
B — Border	7/8	sectors with an abrupt edge
C — Colours	2/6	light brown, blue-grey
D — Diameter	11.6 mm	more than 6 mm

Caution: The lesion touches the image border: A, B and D are less reliable.
Indicative automatic measurements: on the HAM10000 test set, each separates melanoma from nevus only modestly (AUC 0.66 to 0.73). They do not replace dermoscopic examination.

Medical review

Not yet reviewed by a physician.
