Cabinet de dermatologie Es-Senia

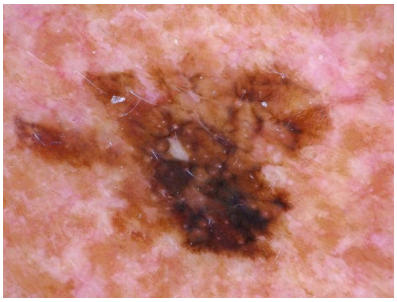

Triage support report — skin lesion

dermIA v2.0.0 · model ham10000-m5-v2 v2.0.0 (full profile)

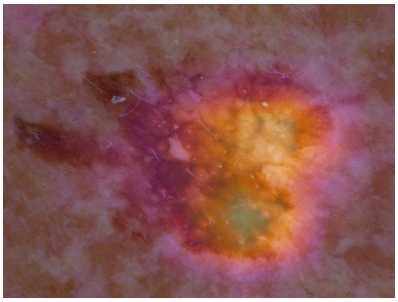

Patient	P-2026-0421	Analysis date	14/10/2026, 18:41
Age	60 years	Requested by	Dr Karim Haddad
Sex	male	Body site	chest
Tracked lesion	#1 — thorax, région sternale	Decision thresholds	original

URGENT

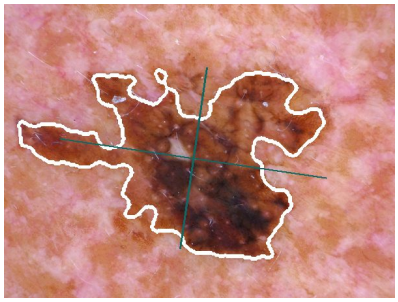

Suspected melanoma
The probability of melanoma exceeds the safety threshold. Prompt dermatological assessment recommended.

Analysed image

Most influential regions (Grad-CAM, “Melanoma”)

Outline and axes used for ABCD

Estimated probabilities

Diagnosis	Probability	In the guaranteed set*
Melanoma	96.8%	yes
Melanocytic nevus	3.0%	
Benign keratosis	0.1%	
Actinic keratosis / Bowen's disease	0.0%	
Basal cell carcinoma	0.0%	
Dermatofibroma	0.0%	
Vascular lesion	0.0%	

* Conformal set (Mondrian, alpha = 0.10): contains the true diagnosis with a probability of at least 90% for each class, assuming the cases resemble the calibration data. Melanoma decision if p(mel) ≥ 0.10 (cost ratio R = 10).
Original model thresholds, calibrated on the HAM10000 calibration set.

Automatic ABCD criteria (indicative)

Criterion	Measure	Detail
A — Asymmetry	2/2	asymmetric principal axes (shape or colours)
B — Border	3/8	sectors with an abrupt edge
C — Colours	4/6	light brown, dark brown, blue-grey, black
D — Diameter	11.8 mm	more than 6 mm

Indicative automatic measurements: on the HAM10000 test set, each separates melanoma from nevus only modestly (AUC 0.66 to 0.73). They do not replace dermoscopic examination.

Change since the analysis of 15/07/2026 (90 days)

• Melanoma probability increased: from 83.8% to 96.8%.
• Diameter increased: from 8.8 mm to 11.8 mm.

Also compare the images visually: framing and magnification may differ between examinations.
