Triage support report — skin lesion

dermIA v2.0.0 · model ham10000-m5-v2 v2.0.0 (full profile)

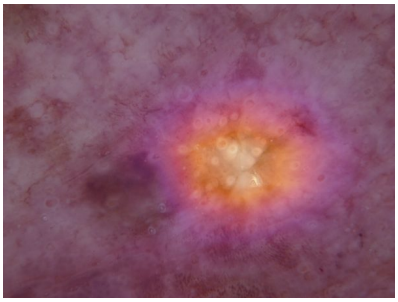

Patient	P-2026-0424	Analysis date	08/10/2026, 08:39
Age	70 years	Requested by	Dr Karim Haddad
Sex	female	Body site	face
Tracked lesion	#1	Decision thresholds	original

SPECIALIST OPINION

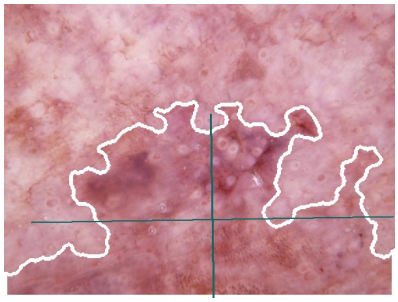

Actinic keratosis / Bowen's disease likely
Probable malignant or pre-malignant lesion. Dermatological assessment recommended.

Analysed image

Most influential regions (Grad-CAM, “Actinic keratosis / Bowen's disease”)

Outline and axes used for ABCD

Estimated probabilities

Diagnosis	Probability	In the guaranteed set*
Actinic keratosis / Bowen's disease	86.2%	yes
Benign keratosis	13.5%	
Melanoma	0.1%	
Basal cell carcinoma	0.1%	
Dermatofibroma	0.0%	
Melanocytic nevus	0.0%	
Vascular lesion	0.0%	

* Conformal set (Mondrian, alpha = 0.10): contains the true diagnosis with a probability of at least 90% for each class, assuming the cases resemble the calibration data. Melanoma decision if p(mel) ≥ 0.10 (cost ratio R = 10).
Original model thresholds, calibrated on the HAM10000 calibration set.

Automatic ABCD criteria (indicative)

Criterion	Measure	Detail
A — Asymmetry	2/2	asymmetric principal axes (shape or colours)
B — Border	3/8	sectors with an abrupt edge
C — Colours	3/6	white, dark brown, blue-grey
D — Diameter	15.5 mm	more than 6 mm

Caution: The lesion touches the image border: A, B and D are less reliable.
Indicative automatic measurements: on the HAM10000 test set, each separates melanoma from nevus only modestly (AUC 0.66 to 0.73). They do not replace dermoscopic examination.

Medical review

Not yet reviewed by a physician.
