Cabinet de dermatologie Es-Senia

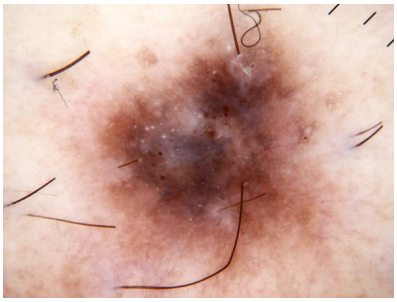

Triage support report — skin lesion

DermIA Prudence v2.0.0 · model ham10000-m5-v2 v2.0.0 (full profile)

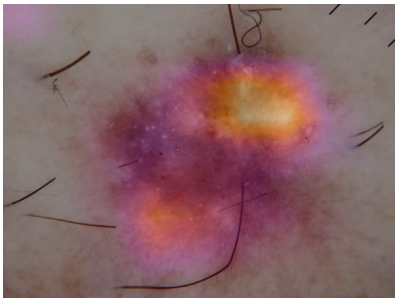

Patient	P-2026-0428	Analysis date	09/10/2026, 05:47
Age	60 years	Requested by	Dr Karim Haddad
Sex	male	Body site	lower limb
Tracked lesion	#1	Decision thresholds	original

URGENT

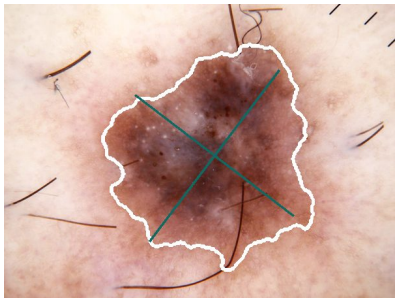

Suspected melanoma
The probability of melanoma exceeds the safety threshold. Prompt dermatological assessment recommended.

Analysed image

Most influential regions (Grad-CAM, “Melanoma”)

Outline and axes used for ABCD

Estimated probabilities

Diagnosis	Probability	In the guaranteed set*
Dermatofibroma	39.2%	yes
Melanocytic nevus	33.6%	
Melanoma	23.4%	yes
Benign keratosis	2.7%	
Actinic keratosis / Bowen's disease	0.9%	
Basal cell carcinoma	0.1%	
Vascular lesion	0.1%	

* Conformal set (Mondrian, alpha = 0.10): contains the true diagnosis with a probability of at least 90% for each class, assuming the cases resemble the calibration data. Melanoma decision if p(mel) ≥ 0.10 (cost ratio R = 10).
Original model thresholds, calibrated on the HAM10000 calibration set.

Automatic ABCD criteria (indicative)

Criterion	Measure	Detail
A — Asymmetry	0/2	asymmetric principal axes (shape or colours)
B — Border	0/8	sectors with an abrupt edge
C — Colours	3/6	light brown, dark brown, blue-grey
D — Diameter	8.9 mm	more than 6 mm

Indicative automatic measurements: on the HAM10000 test set, each separates melanoma from nevus only modestly (AUC 0.66 to 0.73). They do not replace dermoscopic examination.

Medical review

Not yet reviewed by a physician.
